

NATURAL GAS FED FIRE – INSIDE A STRUCTURE

Purpose:

To establish guidelines for the handling of a gas fed fire within a structure.

Guidelines:

- A. Notify PSCC to have Cinergy respond.
- B. Consider a possible rescue problem and take appropriate actions.
- C. Remember to be aware that gas could still be leaking and moving into different areas so place apparatus accordingly until a determination can be made on the leak area.

Control Utilities:

- A. Shut off the gas supply at the meter or curb valve.
- B. Do not attempt to shut down main line gas valves. Cinergy personnel should only perform this procedure.

Fire Control:

- A. If the gas supply cannot be safely shut off, use a fog spray to control the spread of fire until Cinergy personnel can effect a shut down.
- B. Once shut down of the gas is completed, proceed with normal structure fire operations.
